How to connect sql server to android studio

How to connect android studio to sql server 2012. How to connect to sql server database in android studio. How to connect android studio to sql server 2014.

SQL Server is a very widespread database management system and is really useful and easy to use than others! \hat{A} , so, after spending hours, I found a way to integrate my Android application with SQL Server first, download the JTDS driver for the operating system. Now you add this driver for a SQL server. Very easy, but you need to remember the road! Watch my video to add JAR files to your Android Studio: right click on App> New> Module. You will open a window where you can find JAR files when you scroll down. Select the widget will open another window, find the location of your vessel and select. End. Which you can start creating projects with SQL Server after the build is over. Now, after adding JTDS you must add this line to your gradle dependencies application between the files {Implementation project ('; JTDS-1.2.7')} Now we intend to make a java class for SQL Connection server e Android Studio. Remember that this class is the heart of your Android project with SQL server. Use imports correctly. Class.java Import connection Android.annotation.supresslint; IMPORT Android.os.StrictMode; Import Android.util.log; Import java.sql.connection; Import java.sql.drivermanager; Import java.sql.SQLException; ConnectionClass { // Your public class IP address must be static otherwise this will not work. \hat{A} // You can get your IP address // from the network and security in Windows. String IP = "000.000.000.00"; // This is the default setting if you use the JTDS driver. String classes = "net.sourceforge.jtds.jdbc.driver"; // Database name. String db = "mydb"; \hat{A} , // Userame and passwords are necessary for safety. Then go to SQL Server and add the user name and password for the database. String UN = "Username"; Password string = "password"; @Supresslint ("newapi") connection public conn () {politics strictmode.threadpolicy = new strictmode.threadpolicy.builder () .permitall () build (); Strictmode.setthreadPolicy (politics); Connection Conn = null; String Connurl; try {class.forName (classes); CONNURL = "JDBC: JTDS: SQLServer: //" + IP + ";" + "Databasename = " + db + "; user = " + a + "; password = " + password + ";"; CONN = DriverManager.getConnection (CONNURL); } Catch (SQLException SE) {Log.e ("Safiya", SE.GETMESSAGE ()); } Catch (ClassNotFoundException e) {} Catch (Exception e) {Log.E ("error", e.getMessage ()); } Return Conn; } } You can now use the ConnectionClass object to the MAKE connection with the database and run queries on your table. You are all together, now check the application by making a simplea login screen. Strict mode: StrictMode is a development tool that allows you to detect things you could do by chance and brings them to your attention so you can solve them. Strictmode is most commonly used to capture disk or accidental access network on the main wire Appliciona S, where UI operations are received and animations occur. Disk and network maintenance operations The main thread makes it much easier, more interactive applications. Tips: always maintain the separate connection class. So if you change the server address, you just edit a file. Whenever you use a SQL query. Do not run on the main thread otherwise, you will get errors as: \hat{A} , \hat{A} , main discussion ID having skipped load 144 threads. You can async task to run the query in the background while the window of shows loading screen or progress. You can also use Runnable Yarns to move the execution of SQL query from the main user thread for created thread. Display errors use logcat to you face during your execution. Create a package for all diverse classi Java scopo.
